FINETUNE GPTs via Open AI API

1. Take a look at Open AI fine-tuning documentation
2. Fine-tuning supported methods via Open AI
2.1 Supervised Fine-Tuning (SFT)
2.2 Vision Fine-Tuning
2.3 DPO
2.4 RLHF
3. Finetune by Dashboard or python API
4. Fine-tuning step-by-step process
• Collect a dataset examples for training
• Format the dataset in JSONL as per Open AI requirements
• Dataset Format Validation
• Token Counting
• Cost Estimation
• Upload the dataset to the Open AI platform
• Create a fine-tuning job by selecting the appropriate method
• Start the fine-tuning process
• Evaluate the fine-tuned model's performance
5. Fine-tuning best practices from Open AI API
5.1 Data Quality
5.2 Hyperparameter Tuning
5.3 Token Limit

a system role → defines the assistant's behavior
a user role → asks a question
an assistant role → provides the ideal answer

{"messages": [{"role": "system", "content": "You are a customer support agent for a smartphone company whose primary goal is to help users with issues they are experiencing with their smartphones. You are friendly and concise. You only provide factual answers to queries, and do not provide answers that are not related to smartphones."},{"role": "user", "content": "What warranty does a smartphone come with?"},{"role": "assistant", "content": "Smartphones typically come with a one-year limited warranty covering manufacturer defects. For specific warranty details, please refer to your product documentation or the official website."}]}
{

Domain-specific (smartphones only)
Persona-aligned (customer support agent)
Behavior-restricted (no off-topic answers)
Tone-controlled (friendly + concise)

customer support Assistant for smartphone domain only friendly but concise and give factual answers only
